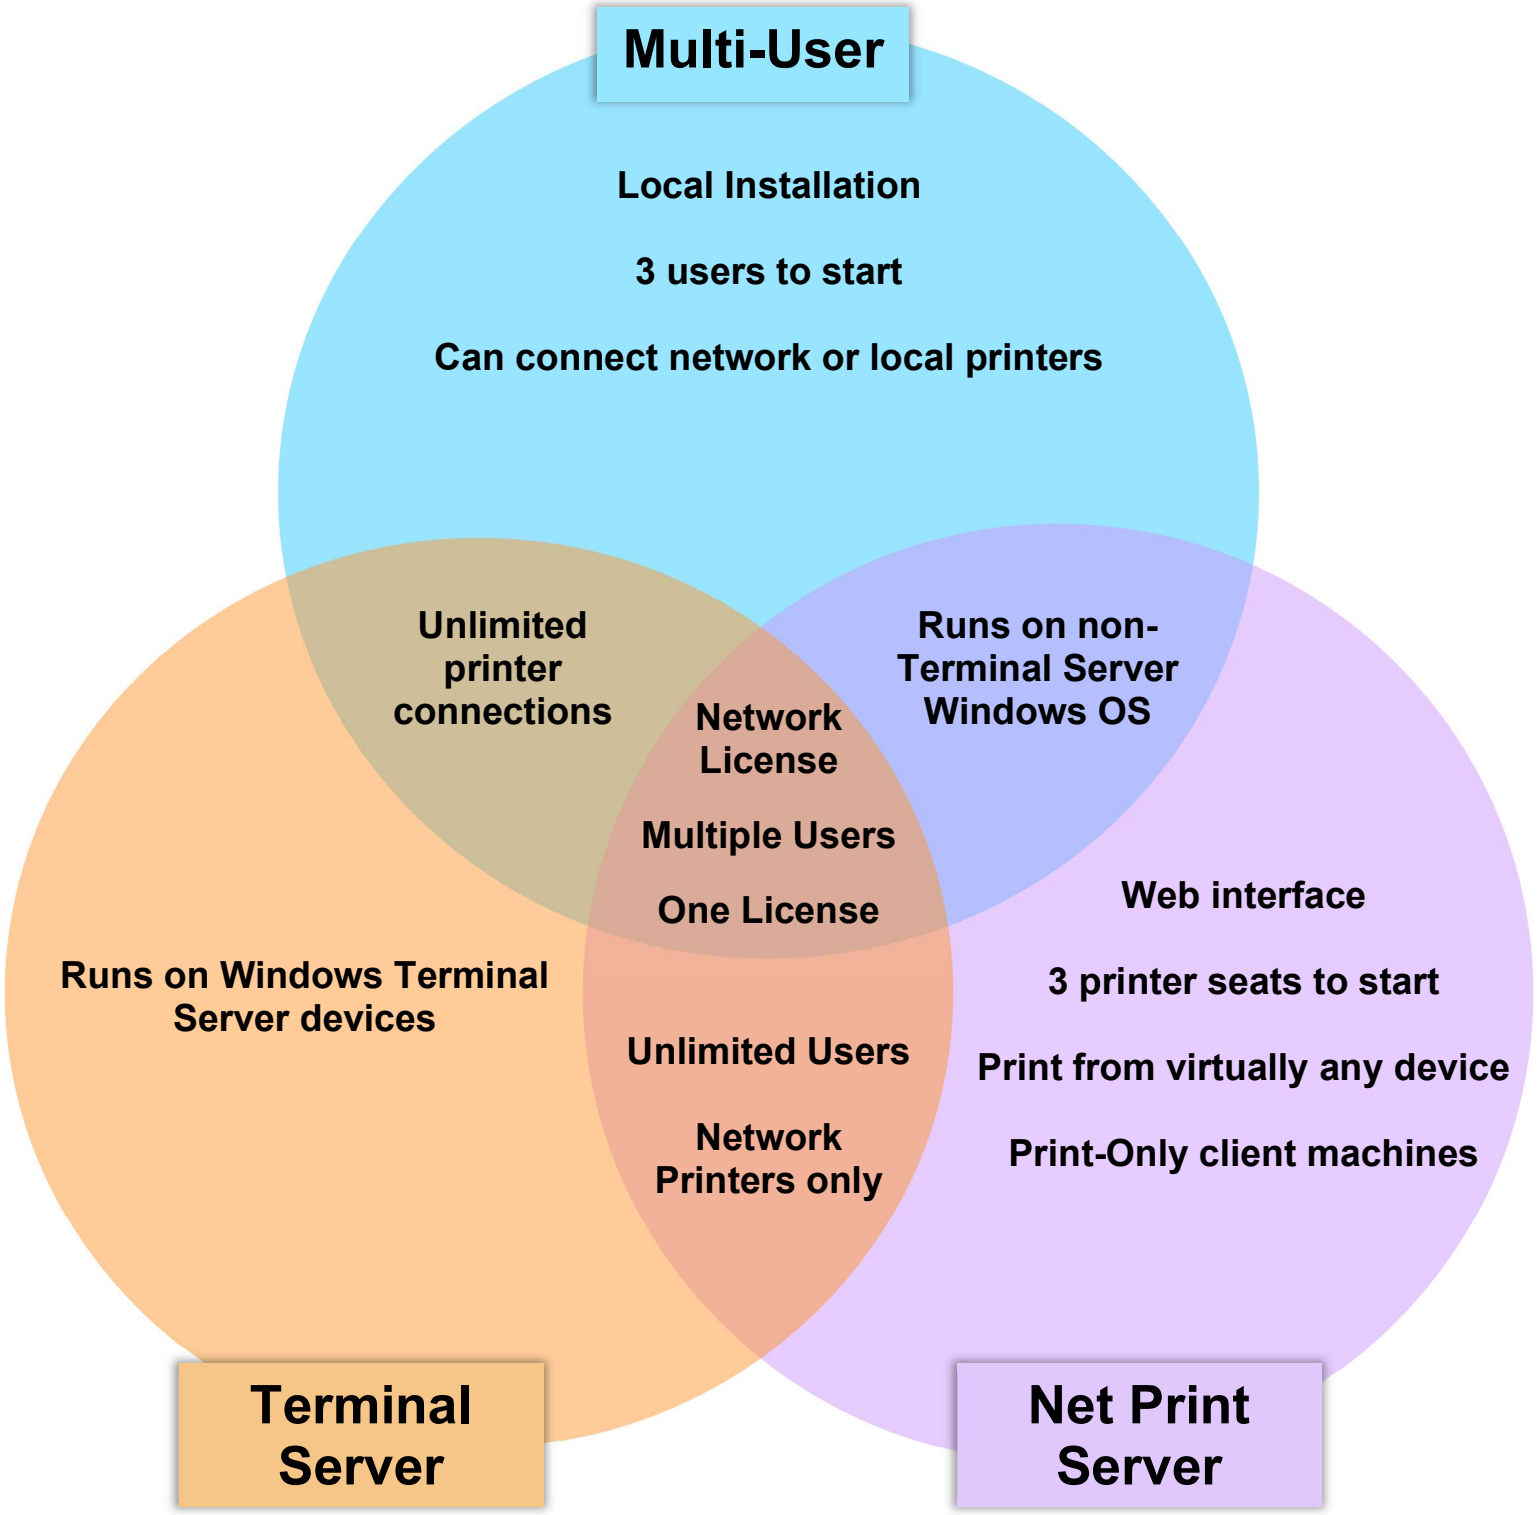
Multiple Concurrent User Network Licenses

Multi-User vs **Terminal Server** vs **Net Print Server**



What is a Network License?

A ***Network License*** is a license that runs over the local network. This singular license (hardware or digital) can allow more than one computer to run a licensed version of EASYLABEL at a time.

Important terms

Users refers to the amount of computer connections. A 3 user Multi-User license can have 3 computers actively using a license at one time, while a Terminal Server license can have an unlimited amount of users

Host or ***Host Machine*** refers to the computer that the physical hardware license key is plugged into, or (if using a Digital License) the machine that the Digital License was installed on. The Host holds the license and shares it across the network.

Client or ***Client Machine*** refers to a computer that is receiving a license, but is not holding or sharing the license.

What is EASYLABEL Multi-User?

EASYLABEL Multi-User allows multiple clients to connect to one host computer. This version can be used with any non-Terminal Server Windows Operating System. It has an unlimited number of printer seats available. The number of users starts at 3, but more can be purchased and added onto the license. This version is capable of connecting to both local and network printers.

What is EASYLABEL Terminal Server?

EASYLABEL Terminal Server is a license specifically designed for the Windows Terminal Server environment. You can use this version of EASYLABEL with as many users as your Terminal Server is capable of having. Terminal server includes unlimited printer connections and unlimited number of users. It does connect to all printers via the network.

What is EASYLABEL Net Print Server?

EASYLABEL Net Print Server is a unique style of license, allowing access to the application as well as a web-based interface. The number of users that can connect to the web-based interface is unlimited (as many as your servers can handle). This web interface allows the user to print the labels. The user can select the label they would like to print, fill in any variable data and any typical Print Request information (batch size, number of batches, printer model, etc.), then click Print. The application interface, which can only be accessed by the host machine, can be used to design, create, and print labels.

What are the capabilities of a Multiple Concurrent User Network License?

All licenses listed above are network licenses, meaning that they provide licenses to their clients via the network. All of these licenses can be run using a Digital License or a hardware dongle. They all allow multiple users (multiple computers) to connect to the license. These licenses all have full EASYLABEL capabilities with the exception of XML printing, which is only available in a Single User Platinum license. Although similar, each license level has specific capabilities.
